Better Management Practices (BMPs) for Seaweed Farming in Tanzania

- Proper siting and farm design
- Proper farming Methods
- Proper seed selection
- Application of planting season Calendar
- Routine management
- Proper harvesting and drying techniques

A healthy marine environment.

- Mangroves and seagrass beds support habitat for fish, invertebrates, birds, and amphibians
- Some species move between mangroves, seagrasses, and coral reefs as they grow – others move between them every day
- Mangroves provide protection from coastal erosion and support fishing and tourism

What is still needed to be done

WAYFORWARD

Partnership

Sustainable &
Quality
